

***Attachment 7: NAS Operational Compatibility See and Avoid***

*Reference: FAA AIR-160 UAPO Guidance Document 08-01*

The INL UA will always be within unaided visual line of site of the Observer, and never higher than 1200 ft vertically from the Observer. Additionally the Pilot and Observer will be co-located in most cases, but will communicate over a dedicated hand held radio in the case a UA is being flown from control by one UA PIC for hand-off to another UA PIC while the Observer(s) are following UAs from the ground.
